

The main advantages of AQUASANITA taps are practical design, convenient control and reliable parts. All AQUASANITA taps have brass bodies and ceramic cartridges. Advanced coating technology protects SILICSANA tap surfaces from scratching and spalling. Tap aerators save water and reduce energy consumption.

To ensure proper care of the tap, please remember that taps are produced using different materials and have different surfaces that react to household detergents differently.

Clean the tap with liquid detergents of neutral pH or a soapy solution. Rub the detergent on the surface, rinse it with warm water and dry it out.

To avoid lime deposits and scratching, use only soft cloths or sponges for cleaning.

From time to time, clean the chrome surface with specialized detergents, which remove stains and add gloss.

From time to time, clean the coated tap surfaces with low concentration scouring milk without abrasive particles, rinse and dry out.

Clean lime deposits around nozzles using a small brush and special detergents containing a vinegar solution.

Do not use acid, chlorine or alcohol based detergents, because they may stain and damage the surface. If you are using such detergent next to the tap, be careful not to splash it on the tap.

Clean or replace the aerator filter on a regular basis.
